

# An Analysis of Unemployment vs Crime

By Dan Laury, Nick Sneed, and Alex Holloway

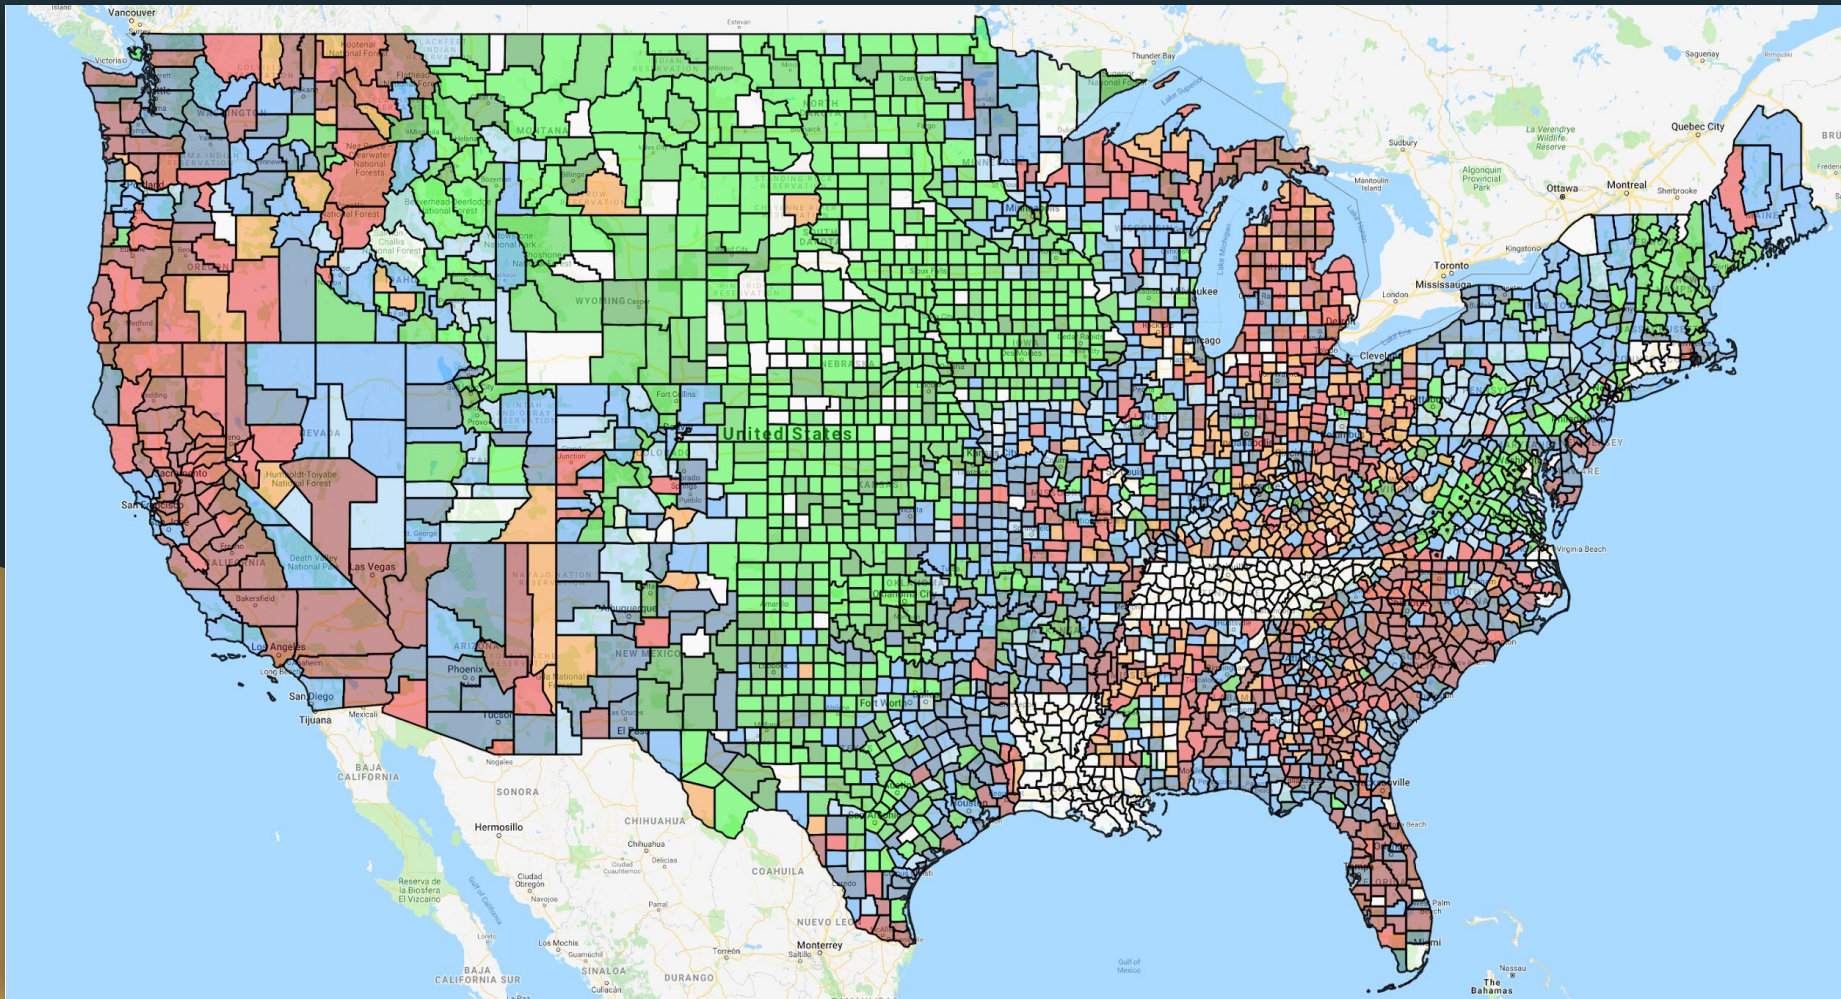

# Motivation & Summary

- In general, America's attitude towards the direction of the country tends to follow the success of the economy. With that in mind we wanted to look at the question of is there a correlation in unemployment rate vs crime rate for a given county?
- Overall, is there a strong correlation between crime rate and unemployment nationwide?
- Does a correlation exist if you look at counties of a certain size?
- Do you see a change in crime rate based on the unemployment rate of the previous year?
- Do you see a short term change in workforce size related to crime rates?
- We did not find a strong correlation between Unemployment Rates vs Crime Rates, based on any of the groupings we analyzed. Data showed that while there is a correlation between Crime Rate and Unemployment rate, a change in unemployment rate is insufficient to explain a change in crime rate for the groupings of data analyzed.
- Due to this, we began to analyze the highest and lowest crime rates to see if they were statistically different from the areas around them. This showed that in an area of 50 miles the area with the highest unemployment had a statically higher crime rate than expected and vice versa.
- This would show, that when taking into account the surrounding area unemployment becomes a better predictor of crime rate.

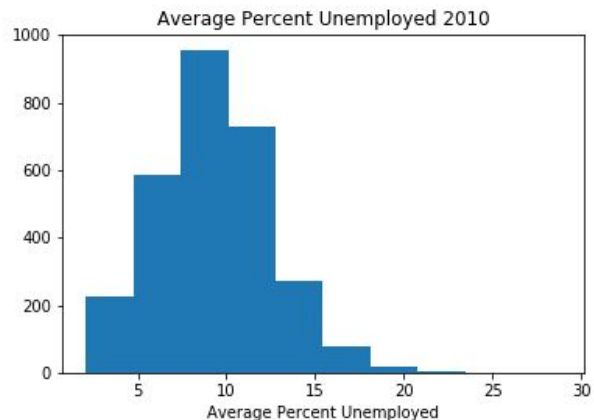

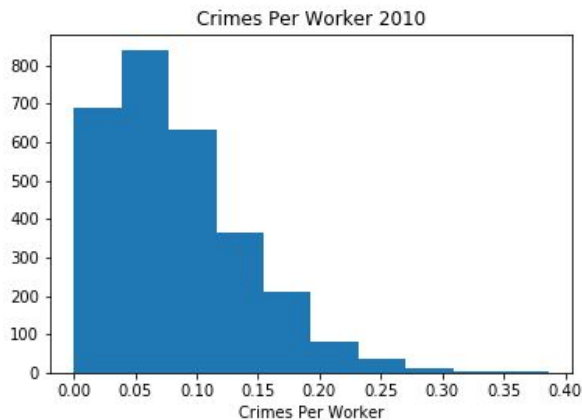

# Questions & Data

- Is unemployment correlated with crime rate?
- Is there a third variable that is responsible for crime rate?
- Does size of county have an effect on crime rate?
- Is the area responsible for the higher rate of crime?
- Data retrieved from:
  - FBI database: <https://api.usa.gov/crime/fbi/sapi/>
  - Bureau of Labor Statistics: <https://data.bls.gov>
  - Google API
- FBI database
  - State, County (multiple precincts reporting), & Number of crimes (totaled from each category)
- Bureau of Labor Statistics
  - State, County, Total Labor Force, Number Unemployed, Percent Unemployed

# Data Cleanup & Exploration

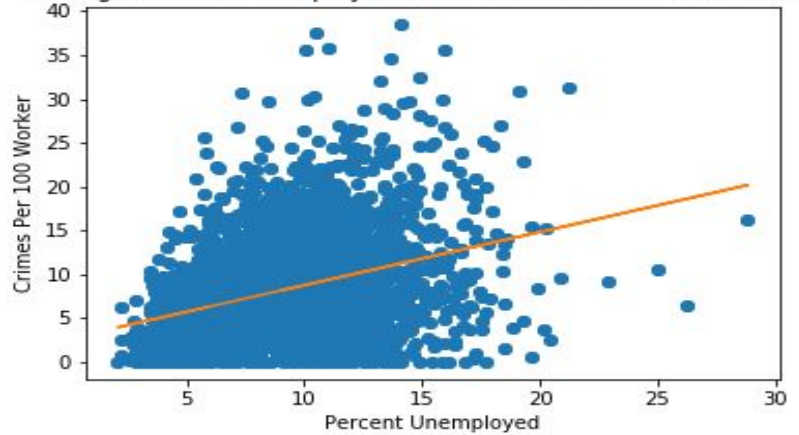

- Combine multiple precincts within counties
- Gather all of the .csv files and format all of the headings to be the same
- Remove county from county names column
- Merge on year, state, and county
- Calculate per capita crime for analysis
- Break the data into years for further analysis
- Noticed duplicate counties
  - E.g. Richardson county and Richards county → Richards
- Dropped zero
- View Distributions by year

# Data Cleanup & Exploration

- Scatter plots of crime vs. unemployment for correlation
- Analyze crime vs. unemployment with box plots

Average Percent Unemployed Vs. Crimes Per 100 Workers (2010)

Crime 2010-2015 (No Outliers)

Unemployment 2010-2015 (No Outliers)

# Data Analysis

- Correlation of crime vs. unemployment
  - R values by year: .33, .38, .35, .29, .28, .25
  - P values by year 6.28e-75, 5.12e-98, 1.56e-84, 1.23e-54, 4.95e-43
  - Correlation seems to be going down by year

# Analysis of Crime-rate Growth vs Unemployment by County Size

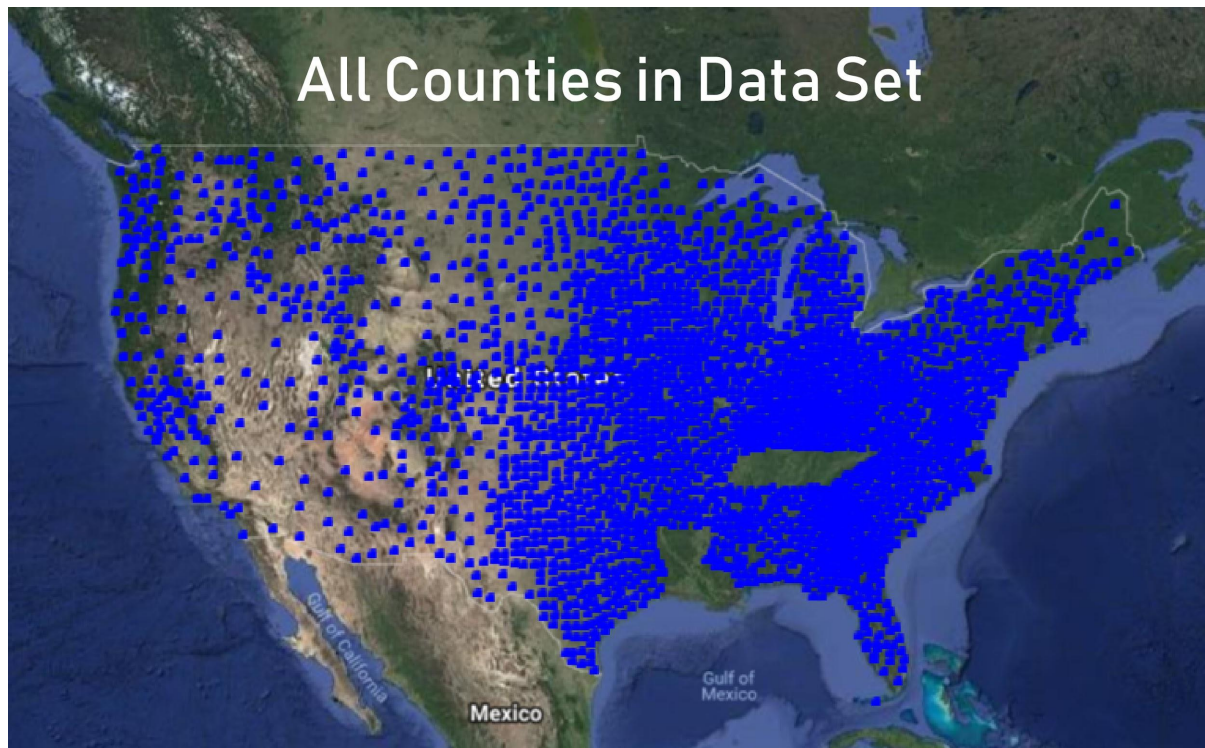

Unemployment level is not an accurate predictor of Crime-rate growth in all sized counties

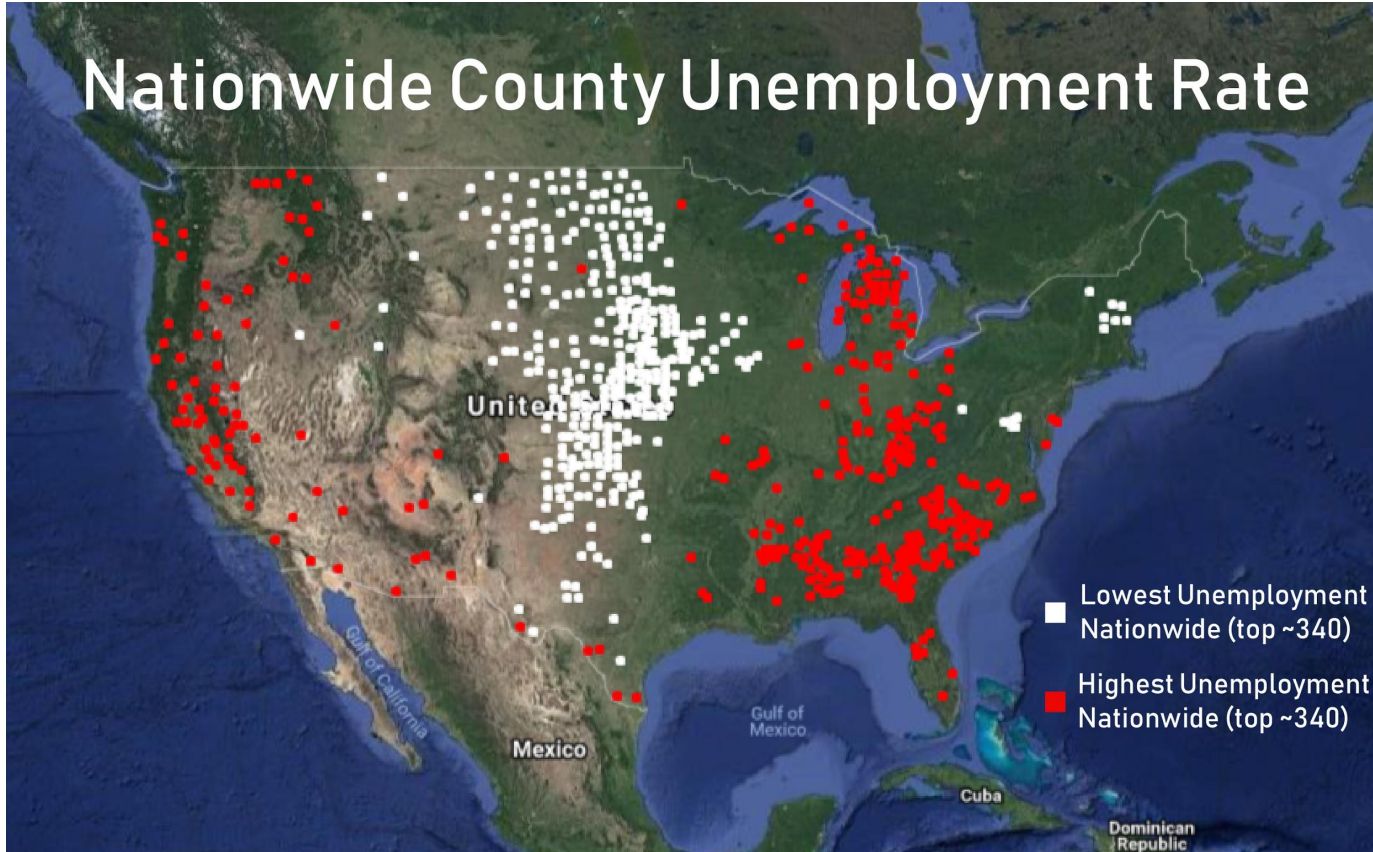

- Shades of red would consistently be at the top of the charts while shades of green would be at the bottom if it was an accurate predictor

# Deeper Dive into Regional Data

# Nationwide County Unemployment Rate

Potential Confounding Variables:  
Industry, Culture, Natural Resources, Weather, Politics

# Regional Data Analysis - Method

Definition of Region: The set of counties whose center is within a 50 mile radius of the target county.

County Coordinates gathered from Google

Calculated distance between counties with geodesic distance algorithm (geopy)

Create regional data arrays for Crime Rate and Unemployment Rate

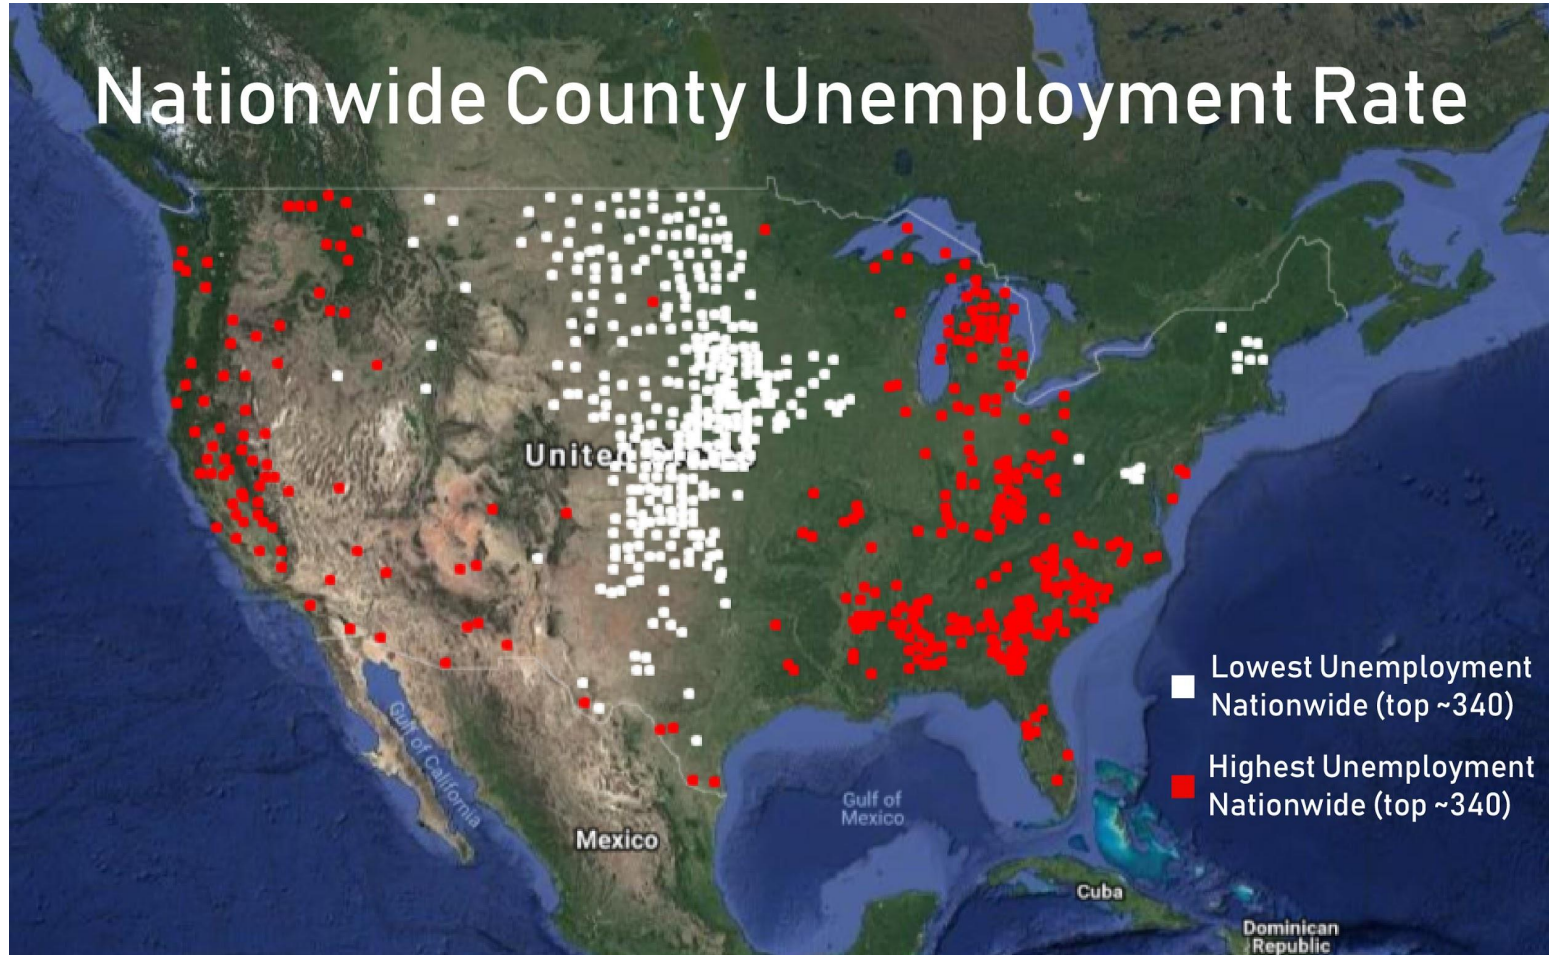

Drop Counties that have no regional neighbors

Determine the regional minimum and maximum for each array

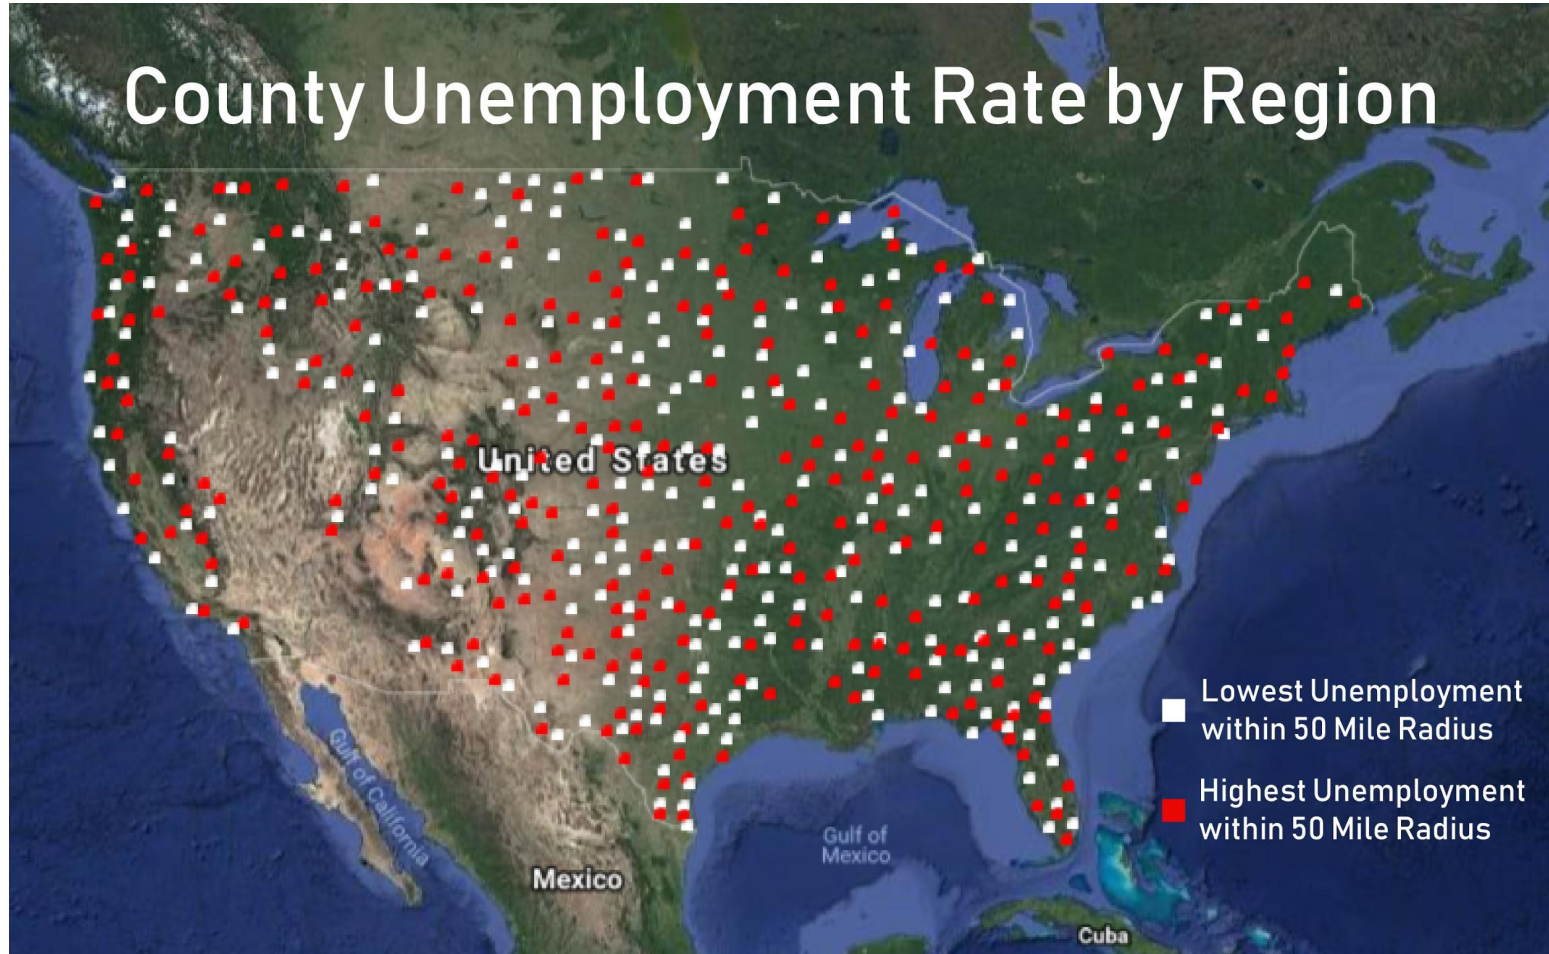

Perform Chi Square on County Rate vs Region Mean Rate

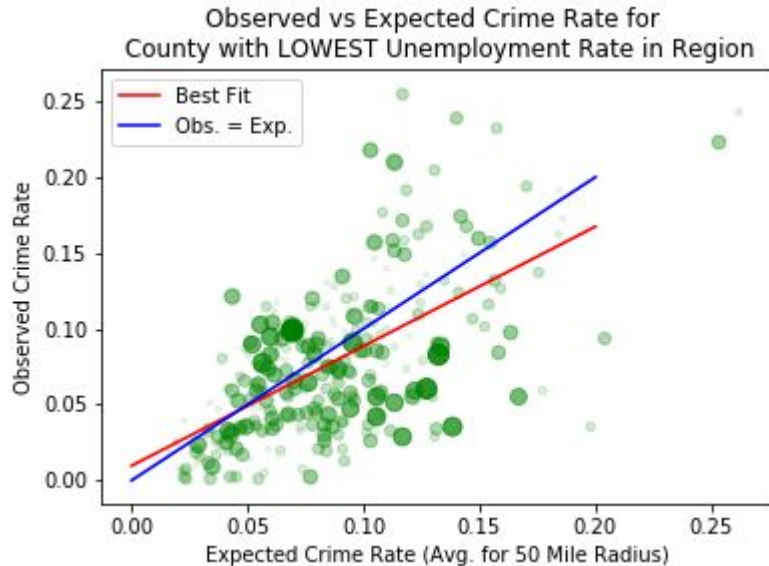

# Nationwide County Unemployment Rate

# County Unemployment Rate by Region

# Chi Square analysis for Lowest and Highest County Unemployment Rate in region (50 Mile Radius)

$H_0$ : The crime rate for the county with the lowest unemployment rate will match the region average.

Crit. Value = 4.74    Statistic = 336.88    Slope = 0.79

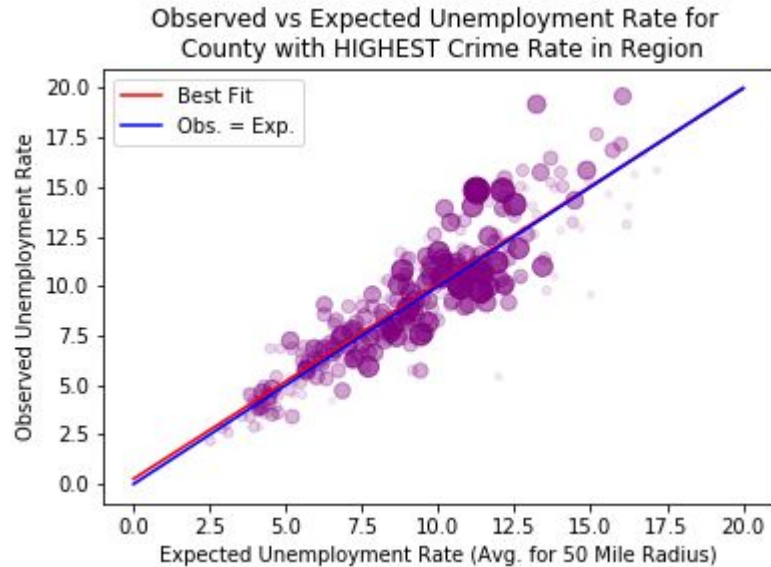

$H_0$ : The crime rate for the county with the highest unemployment rate will match the region average.

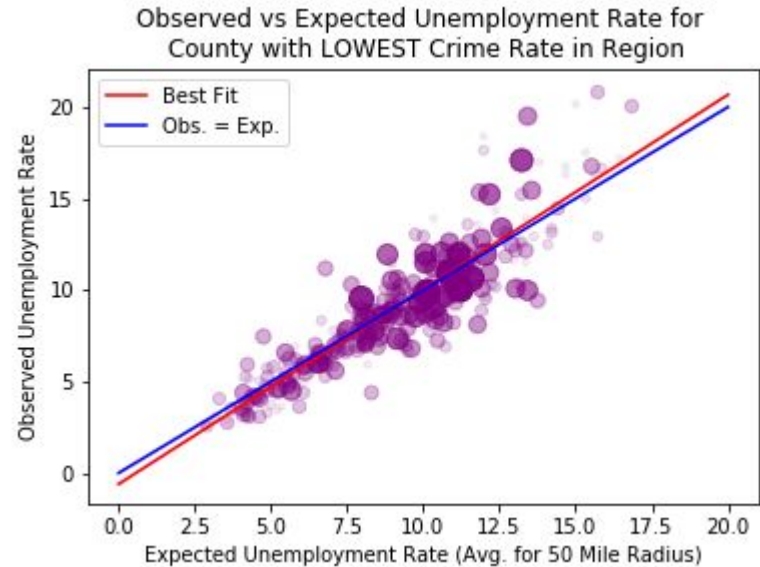

Crit. Value = 5.49    Statistic = 343.46    Slope = 1.19

# Chi Square analysis for Highest and Lowest County Crime Rate in region (50 Mile Radius)

Crit. Value = 70.31    Statistic = 381.78    Slope = 0.99

Crit. Value = 70.44    Statistic = 355.53    Slope = 1.06

# Discussion

- Unemployment does seem to be correlated to crime rate.
- When accounting for surrounding area, it seems to be a better predictor.
- Size of county does not seem to have any correlation with crime rate.
- When examining Unemployment vs Crime rate regionally Unemployment rate is a strong predictor for Crime rate yet Crime rate is not a strong predictor for Unemployment rate.
- While there is a correlation between crime and unemployment, seems to be bivariate at least.
- We did not find exactly what we were expecting.
- Move to the midwest.

# Post Mortem

- FBI API calls are limited to 1000 per hour.
  - Alternate keys
  - Split data retrieval across multiple devices
- BLS reports data on a monthly basis Crime Data
- Additional Questions:
  - What could be other confounding variables outside of area? Gender, race, age?
- Additional Research:
  - Break unemployment down and research crime vs. average yearly income
  - See if low income housing affects crime rates.
  - Regional change over time
